

Medical Oncology Follow-up Note

Dana Keller | MRN DEMO-BC-001 | DOB 1974-02-11 | Female

Encounter date	2026-08-03
Document type	Medical oncology follow-up / preoperative handoff
Primary diagnosis	Left-breast invasive ductal carcinoma
Initial clinical stage	AJCC 8th edition stage IIB (cT2 cN1 cM0)
Biology	ER positive / PR negative / HER2 negative
Performance status	ECOG 0

Oncologic history

The patient was diagnosed in April 2026 with node-positive invasive ductal carcinoma of the left breast. She completed neoadjuvant dose-dense doxorubicin/cyclophosphamide followed by paclitaxel; the final paclitaxel dose was administered on 2026-07-20. Treatment was completed without dose-limiting toxicity.

Current assessment

Post-treatment breast MRI demonstrates a partial radiographic response with residual enhancement at the known primary site and no new suspicious lesions. The previously abnormal left axillary node is no longer morphologically enlarged. She is clinically well, with mild residual fatigue and no active infection.

Plan

Proceed with breast-conserving surgery consisting of left partial mastectomy with image-guided localization and sentinel lymph-node biopsy with targeted removal of the previously clipped axillary node. Postoperative systemic and radiation recommendations will be finalized after review of the surgical pathology.

Source context

This note summarizes prior treatment history for clinical handoff. Exact chemotherapy administration records are not included in this five-document demonstration packet.
