

Breast MRI - Treatment Response Report

Dana Keller | MRN DEMO-BC-001 | DOB 1974-02-11 | Female

Study	Bilateral breast MRI with and without contrast
Exam date	2026-07-29
Indication	Response assessment after neoadjuvant systemic therapy
Comparison	Breast MRI 2026-04-23

Findings

Left breast	Residual irregular enhancement at 2 o'clock measures 1.7 x 1.1 x 1.0 cm, decreased from 4.6 x 3.1 x 3.0 cm on the prior examination.
Left axilla	Previously abnormal level I axillary node has decreased in size and now demonstrates normal cortical thickness. Biopsy clip is present.
Right breast	No suspicious enhancement.
Skin / chest wall	No skin thickening or chest-wall invasion.
Other	No new suspicious internal mammary or axillary adenopathy identified.

Impression

Partial imaging response to neoadjuvant therapy with residual 1.7 cm enhancement at the known left-breast malignancy. Interval normalization of the previously biopsy-proven metastatic left axillary node. No new suspicious breast or nodal finding.
